

Mew Gull *Larus canus heinei* in Gujarat in January 2006

Klaus Malling Olsen: Smørumvej 221, 2 t.v., DK 2700 Brønshøj, Denmark. klausmallings@gmail.com

Klaus Olsen

The Mew Gull (*Larus canus*), also known as the Common Gull, breeds across the northern Palearctic. It was stated by Rasmussen & Anderton (2005) that the species is a vagrant in South Asia, including in NW India, but with no specimens known and had only been sight-recorded in the region, mentioning the 'probable occurrence' of Central Russian breeding subspecies *heinei* here in South Asia.

During gull-watching (*Larus* sp.) in Gujarat in January 2006, I came across two birds in a group of larger gulls at the harbour of Nava Bandar, near Una, in Gujarat. The two smaller gulls immediately caught my eye by being about 70% smaller than the larger gulls present and, as can be seen in the photos, had a much gentler appearance with smaller, rounded head, larger eyes and a smallish bill. One of the birds had some damage in the wing, as can be seen from the photos. Both the birds were readily identified as Mew Gulls. From the photos, it was possible to identify the birds as belonging to the subspecies *heinei*, which breeds from Central Russia and eastwards, and winters mainly in the Black Sea and Caspian Sea areas, with regular occurrence eastwards to Eastern China and westwards to Western Europe.

The subspecies identification of Mew Gull has been treated in detail by Malling Olsen & Larsson (2004), Adriaens & Gibbins (2016), and Malling Olsen (2018). The identification to subspecies *heinei* was possible here based on the almost

unmarked head and underbody, as well as just faint dark markings on the underwings. Albeit with some variation, the western subspecies *L. c. canus* (Europe to Moscow, wintering mainly within Europe) shows more extensive dark markings on head and underbody, as well as being on average slightly smaller, with slightly paler grey upperparts/mantle in first winter plumage.

This was the first photographic record of a Mew Gull from Gujarat, and possibly India too. In Gujarat, there are just two further records (Prasad Ganpule, *pers comm.*, by e-mail), but it is suspected it may be a regular winter visitor, at least in NW India, and especially in Gujarat.

[The Mew Gull is also known as the Common Gull. Rasmussen & Anderton (2012) and Praveen et al. (2014) use Mew Gull for *Larus canus* and the same is followed here. Praveen et al. (2014) list only 10 records of Mew Gull from India till 2014, including the above record. For Gujarat, and also India, this was probably the first photographic documentation of Mew Gull. For Gujarat, as stated by the author, two more records are known; a sighting (with photograph) by James Eaton from Bhuj (Eaton 2013) and a record from Little Rann of Kachchh in October 2015 by Prasad Ganpule (P. Ganpule, in print). It is likely that the Mew Gull is more common than believed and could be overlooked in the flocks of gulls seen here. Bird watchers are requested to look out for Mew Gull here in Gujarat – Eds]

Tagged Black Kite *Milvus migrans* near Rajula, Amreli District

Ashvinkumar H. Italiya: 'Ambekrupa Nivas', Opp. Limda-Gadhada Road, Village: Limda, Ta: Umralla, Dist: Bhavnagar.
forensicworld.gujarat@gmail.com

On 7 December 2018, I saw and photographed a wing-tagged Black Kite (*Milvus migrans*) near Rajula, in Dist: Amreli. The Black Kite was having a green wing tag on its left wing, with '077' printed on the tag. A metal ring was visible on its left leg but the numbers on the ring were not readable. I was very intrigued to see this tagged bird and took some photographs.

I posted the photos on Facebook and tried to find out the tagging details. The photos were widely circulated and the following tagging information was obtained from the Hiddensee Bird Ringing Centre, Guestrow, Germany:
